Esté informe contiene información muy importante sobre el agua que usted toma. Tradúscalo o hable con un amigo quien lo entienda bien.

**City of Columbia
is proud to supply its customers
with award winning drinking water.**

**Please turn on the tap
and enjoy.**

A Publication of the City of Columbia's
Department of Utilities and Engineering

COLUMBIA WATER: QUALITY ON TAP SINCE 1835

The United States Environmental Protection Agency (EPA) and the South Carolina Department of Health and Environmental Control (SCDHEC) have established strict quality standards for drinking water. These standards are designed to protect consumers against disease-causing bacteria and other harmful substances. EPA requires public water systems to send their customers an annual report containing information about their drinking water quality and compliance with the standards. The City of Columbia is pleased to present the information contained in this report to you and hope that it will be both informative and helpful in making personal health-based decisions regarding your drinking water consumption. We welcome your comments and questions. We may be reached during normal business hours by calling 803-545-3400. You are also welcome to attend regularly scheduled meetings of City Council that are generally held the first and third Wednesdays of each month at City Hall, 1737 Main Street at 10:00 a.m. Contact the Public Relations Department at 803-545-3020 for time and location or visit www.columbiasc.net.

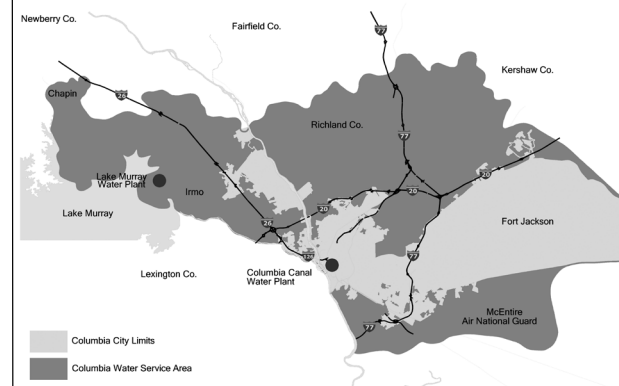

WHERE DOES COLUMBIA'S WATER COME FROM?

The City of Columbia operates two water treatment plants, one of which draws water from the Broad River Diversion Canal (Canal) and the other from Lake Murray (Lake). The two plants together produce an average of 60 million gallons of water per day that is furnished to approximately 375,000 people in Richland and Lexington Counties through more than 2,400 miles of underground pipeline. Generally, the Lake Murray Plant serves the area west of the Broad River and the area north of Interstate 20, and the Columbia Canal Plant serves the remaining area. The system is designed, however, so that sustainable water can be supplied to the entire service area by either plant.

The City of Columbia uses a series of treatment techniques to produce potable (drinkable) water. As water is pumped into the treatment plants, intake areas screen out floating debris such as plants and fish. Aluminum sulfate (alum) and other polymers are rapidly mixed into the water to help particles in the water cling together (coagulate) and form heavier particles, referred to as floc. The water mixture is then gently circulated so that the coagulating particles continue to merge into larger floc particles. These floc particles pass into a sedimentation basin where they settle to the bottom and are eventually disposed of. Filtration removes any remaining particles. The water passes through filters containing layers of sand and anthracite coal. Small floc particles cling to filter material as water passes through. After all particles have been removed, a small amount of chlorine is added to the water to keep bacteria from developing as it travels to your home or business. A small amount of fluoride is also added to the water to assist in preventing tooth decay.

The SCDHEC has completed a comprehensive water assessment report on the Broad River Diversion Canal (also referred to as the Columbia Canal) and Lake Murray. This Source Water Assessment report is available and can be reviewed at 1136 Washington Street or by contacting 803-545-3400.

City of Columbia Water Service Area

What’s In Columbia’s Drinking Water?

The City’s DHEC-certified laboratory performs more than 200,000 analyses each year to insure that the water the City supplies to its customers meets all EPA and DHEC standards at all stages of the treatment process and at hundreds of points throughout more than 2,400 miles of pipeline that make up the City’s distribution system. The City also conducts voluntary testing for microbial contaminants. In 2004, the City joined the Partnership for Safe Water, a group that encourages water suppliers to enhance their water system’s ability to prevent entry of microbial contaminants and to implement any actions that are appropriate in accomplishing this goal. The City’s drinking water met all state and federal requirements during 2010 and is considered safe to drink. The substances listed below were detected in the City’s water supply during 2010 or during the most recent sampling period if sampling was not required during 2010.

SUBSTANCE	HIGHEST LEVEL ALLOWED (MCL)	DETECTED LEVEL	RANGE OF DETECTION	GOAL (MCLG)	VIOLATION	YEAR SAMPLED	SOURCE OF CONTAMINANT
INORGANIC COMPOUNDS							
Lead	15 ppb (Action Level)	0 ppb	One of 49 sites sampled exceeded the action level.	0	None	2008	Corrosion of household plumbing systems and naturally occurring in the environment. If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service line and home plumbing. The City of Columbia is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead .
Copper	1.3 ppm (Action Level)	0.1 ppm	No sites exceeded the action level.	0	None	2008	Corrosion of household plumbing systems and naturally occurring in the environment.
Fluoride	4 ppm	0.80 ppm	0.76 - 0.84 ppm	4 ppm	None	2010	Naturally occurring in the environment by erosion of natural deposits and added at the treatment plant as an aid in preventing tooth decay.
Nitrate/Nitrite (as Nitrogen)	10 ppm	0.22 ppm	0.14 - 0.30 ppm	10 ppm	None	2010	Runoff from fertilizer use, leaching from septic tanks, sewage, erosion of natural deposits.
Chlorite (Lake Plant) (Canal Plant)	1 ppm 1 ppm	0.665 ppm 0.689 ppm	0.336 - 0.665 ppm 0.349 - 0.689 ppm	0.8 ppm 0.8 ppm	None None	2010 2010	By-product of drinking water chlorination.
ORGANIC COMPOUNDS							
Total Trihalomethanes (THMs) (Chloroform, Bromodichloromethane, Dibromochloromethane, Bromoform)	80 ppb	26 ppb (Average)	14.8 - 39.9 ppb	0	None	2010	By-product of drinking water chlorination formed when chlorine reacts with organic matter.
Haloacetic Acids (HAAs) (Monochloroacetic Acid, Monobromoacetic Acid, Dichloroacetic Acid, Trichloroacetic Acid, Dibromoacetic Acid)	60 ppb	36 ppb (Average)	13.3-61.0 ppb	0	None	2010	By-product of drinking water chlorination formed when chlorine reacts with organic matter.
Total Organic Carbon (Lake Plant)	TT	44.58% Removal (40.83% Removal Required)	37.20% - 48.80% Removal	None	None	2010	Naturally occurring in the environment.
(Canal Plant)	TT	44.68% Removal (35.83% Removal Required)	37.00% - 62.60% Removal	None	None	2010	Naturally occurring in the environment.
MICROORGANISMS							
Turbidity (Lake Plant)	<0.3 NTU Treatment Technique	0.06 NTU - Highest single measurement 100% - Lowest monthly percentage meeting standard		Not Applicable	None	2010	Naturally occurring in the environment
(Canal Plant)	<0.3 NTU Treatment Technique	0.73 NTU - Highest single measurement 99.17% - Lowest monthly percentage meeting standard		Not Applicable	None	2010	Naturally occurring in the environment.
Total Coliform Bacteria	Presence of coliform bacteria in < 5% of monthly samples.	2.06% (highest monthly percentage positive)	Not Applicable	0	None	2010	Naturally occurring in the environment.
DISINFECTANTS	MAXIMUM RESIDUAL DISINFECTANT LEVEL (MRDL)			GOAL (MRDLG)			
Chloramine	4 ppm	2.7 ppm (highest quarterly average)	2.1 - 2.7 ppm	4 ppm	None	2010	Water additive to control microbial growth.
Chlorine Dioxide (Lake Plant) (Canal Plant)	800 ppb 800 ppb	144 ppb 165 ppb	0 - 144 ppb 0 - 165 ppb	800 ppb 800 ppb	None None	2010 2010	Water additive to control microbial growth. Water additive to control microbial growth.

* We have been monitored for UCMR2 in 2010. No detections were noted. If you would like to receive the list of contaminants monitored, please contact Jon Sherer at 803-255-8160.

What do these terms and symbols mean?

- Action Level**-A limit (not MCL) that applies to contaminants, such as lead and copper, that enter the water after treatment. Action levels may trigger special monitoring, public education or treatment techniques.
- Detected Level**-Concentration of a substance detected in a water sample. The detected levels specified in the above tables are the highest levels detected if multiple samples were collected, except for Total Organic Carbon (TOC) or unless specified otherwise. For TOC, the specified removal rate is the rate required by the SCDHEC, based on data reported by the City.
- MCL** (Maximum Contaminant Level)-The EPA's regulation limit for the highest allowable amount of a substance in drinking water.
- MCLG** (Maximum Contaminant Level Goal)-The EPA's target level for a contaminant below which there are no known or suspected health effects. The MCLG is not necessarily a level achievable with currently available treatment techniques.
- MRDL** (Maximum Residual Disinfectant Level)-The maximum permissible level of a disinfectant added for water treatment that may not be exceeded at the consumer’s tap without an unacceptable possibility of adverse health effects.
- MRDLG** (Maximum Residual Disinfectant Level Goal)-The maximum level of a disinfectant in drinking water at which no known or anticipated adverse effect on the health of persons would occur and that allows for an adequate margin of safety. MRDLG’s are non-enforceable public health goals.
- N/A**-Not applicable, does not apply.
- NTU** (Nephelometric Turbidity Unit)-Units used to indicate water clarity.
- ppb** (parts per billion)-One part in a billion parts (equivalent to one penny in \$10,000,000).
- ppm** (parts per million)-One part in a million parts (equivalent to one penny in \$10,000).
- RAA** (Running Annual Average)-An average of the four quarters in a calendar year.
- TT** (Treatment Technique)-A required process intended to reduce the level of a contaminant in drinking water.
- UCMR2**-Unregulated Contaminant Monitoring Regulation 2.
- 90th Percentile**-The “action level” for lead and copper for a water system that serves more than 100,000 people.
- < Less than
- > Greater than

The EPA requires that all annual water quality reports contain the following:

- Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (800-426-4791).
- The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and radioactive material, and can pick up substances resulting from the presence of animals or from human activity.
- Contaminants that may be present in source water include:
- *Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
 - *Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
 - *Pesticides and herbicides, which may come from a variety of sources such as agriculture, stormwater runoff and residential uses.
 - *Organic chemical contaminants, including synthetic and volatile organics, which are by-products of industrial processes and petroleum production and can also come from gas stations, urban stormwater runoff and septic systems.
 - *Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.
- In order to insure that tap water is safe to drink, the EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Federal Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.
- Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons, such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium are available from the Safe Drinking Water Hotline (800-426-4791). Testing since 1994 has revealed no signs of Cryptosporidium in Columbia’s treated water.
